

Today I was remembering my first - supposed - infection with malware. It was --.--. I was working on a saturday in Utrecht for a large IT-Compagny. When I visit a popular website - for news - www.nu.nl my mcafee virusscanner alerts me about a virus. I scared the hell out, my first contact with the cruel outside cyberworld.

Today 14-03-2012 it was www.nu.nl again.

See:

http://www.security.nl/artikel/40727/1/NU.nl_besmet_bezoekers_mit_malware.html

<http://tweakers.net/nieuws/80668/nu-punt-nl-serveerde-kortstondig-malware.html>

and a good analyze

<http://sijmen.ruwhof.net/weblog/166-nu-nl-gehackt-malware-analyse>

I hope we have no infections. I am - very! - happy we have just updated all flashplayers and adobe readers to the latest editions, and most of the java-software.

Update: 16-03-2012
We haven't had any infection, pfffff.

But here is a possible solution if someone is infected.

Use the Kaspersky Anti-rootkit utility [TDSSKillier](#).

To start this remote and unattended use: **tdsskiller -silent**
